Disclaimer, Forward Looking Statements and Competent Person Statement

This presentation has been prepared by Pryme Energy Limited (the “Company”). This presentation is being provided to investors for the sole purpose of providing preliminary background financial and other information to enable recipients to review the business activities of the Company. It is not intended as an offer, invitation, solicitation or recommendation with respect to the purchase or sale of any securities in the Company.

The information presented in this presentation may contain predictions, estimates and other forward-looking statements. Although the company believes that its expectations are based on reasonable assumptions, it can give no assurance that its goals will be achieved. Important factors that could cause actual results to differ materially from those included in the forward-looking statements include the timing and extent of changes in commodity prices for oil and gas, the need to develop and replace reserves, environmental risks, drilling and operating risks, risks related to exploration and development, uncertainties about the estimates of reserves, competition, government regulation and the ability of the company to meet its stated business goals.

Prospective investors should make their own independent evaluation of an investment in the Company or seek advice from their financial adviser, accountant, lawyer, stockbroker or other professional adviser. Nothing in this presentation should be construed as financial product advice, whether personal or general, for the purposes of Section 766B of the Corporations Act, or otherwise. This presentation does not amount to, involve or imply a recommendation or a statement of opinion in respect of whether to buy, sell or hold a financial product.

Technical information contained in this presentation in relation to Turner Bayou was compiled by Pryme and reviewed by Mr Greg Short, BSc. Geology (Hons), a Director of Pryme who has more than 33 years’ experience in the practise of petroleum geology. Mr Short consents to the inclusion in this presentation of the information in the form and context in which it appears.

Corporate History

Incorporated: October 2005

ASX Listing: April 2006

Projects on listing:
- LaSalle Parish Project
- Turner Bayou 3D Seismic

Corporate Vision: Identify, explore and develop high return oil and gas projects from a platform of low risk, profitable and long life oil and gas income

12 Month Plan:
- Execute on Turner Bayou “Company Maker” project
- Continue to review, evaluate and high grade next “High Impact” project

Board of Directors:
- George Lloyd (Chairman)
- Justin Pettett (Managing Director)
- Ryan Messer (Chief Operating Officer)
- Greg Short (Non-executive Director)
Pryme Energy ASX Share Price Trading History (12 months)
Company Snapshot

Major Exploration Upside through Turner Bayou
Stable oil and natural gas production

Current Daily Production (Net to Pryme)
Oil 82 Bbls/day
Natural Gas 165 Mcf/day*

Total /Day 110 BOE/day
Total /Month 3,344 BOE/month

*Natural gas is converted at a ratio of 6.1:1 into barrels of oil equivalent.

A Pryme Platform for Growth
- A combination of low risk oil and gas exploration and production with substantial upside from high impact exploration
- Strong, strategic mineral lease positions in key projects
- High impact projects with very large upside potential
- Strong deal flow

Solid foundation of assets
**Value Proposition**

- Proven reserves in Turner Bayou are based on the area of influence of the Deshotels 20H and 13H and reflects their sub-optimal completion and low levels of production. The reserve estimate does not reflect the potential of the project area which is much greater than this area of influence.
- 1P and 2P NPV10 **valued at A$0.32 per share**
- 1P and 2P oil reserves only **valued at A$6.61 per barrel**
- 1P and 2P oil and natural gas reserves **valued at A$5.57 per barrel** of oil equivalent
- Improved results from new Turner Bayou wells will significantly impact all reserve categories positively

---

**Oil and Gas Reserves at 31 December 2011**

MBOE – Oil equivalent expressed in thousands of stock tank barrels (MBO), where one barrel is equivalent to 42 United States gallons.

Value per share calculated by dividing current shares on issue into discounted cash flow for each project using an AUD/USD exchange rate of 1.00 from Petro Partners, Inc summary of reserves as at 31 December 2011.
Turner Bayou
A Company Making Project

- Shot 80 square mile (52,000 acre) 3D survey in 2007
- 24,000 acres under lease (9,600 acres net to Pryme) in Austin Chalk play area
- Pryme owns 40% working interest (30% NRI)
- Recoverable oil 500,000 Bbls – 1,000,000 Bbls per well (150,000 Bbls - 300,000Bbls per well net to Pryme)
- Based on 640 acre well spacing, we estimate that, fully developed, the prospective area has potential to support up to 30 wells
- Initial production rates average over 1,000 barrels per day of oil in region
- Significant shows and/or production from all targeted intervals
- Oil attracts premium of approximately 10% on West Texas Intermediate (WTI) pricing due to demand in the local area

High rate of return in the area
Austin Chalk Regional Trend Map and Project Location

Field Cumulative Production
- N & S Burr Ferry: 7,086,894 BOE
- Masters Creek: 77,547,576 BOE
- North Bayou Jack: 1,219,974 BOE
- Moncrief: 3,165,215 BOE
- West Cheneyville: 3,720,524 BOE
Turner Bayou Stratigraphic Column

- Thinner chalk is one element that dictates better production in Masters Creek Field to the west due to higher fracture density.

- The TMS is the Louisiana equivalent of South Texas’ highly prospective Eagle Ford formation.
Higher fracture density the higher the productivity of the Austin Chalk

- Horizontal drilling increases potential of productive structures
- Several vertical wells were drilled on our survey in the period from the late 1970’s to the mid 1990’s and include one of the best vertical wells in the trend which produced 572,000 Bbls of oil and 0.58 Bcf of natural gas from one fracture network
- Interpretation indicates an erosional event occurred during the Upper Cretaceous age causing chalk to thin from 1,000 feet to 450 feet in some sections
- Results of Deshotels 20H, 13H and Rabalais 35H well support geologic and geophysical interpretation
Deshotels 20H (40% WI)

- 12 major oil and gas bearing fracture zones, many smaller fractures intersected
- Gas shows and oil over shakers while drilling
- Currently producing 75 barrels of oil per day gross (23 barrels per day net to Pryme)
- Not indicative of expected production rates due to mechanical problems during completion and stimulation which were not encountered in second well
- Plan to install lift system on well to improve production

Deshotels 13H (40% WI)

- 15 major oil and gas bearing fracture zones, many smaller fractures intersected
- Burning up to a 70 foot flare and oil produced to surface
- 128 oil bearing fractures indicated by fracture identification log
- Currently producing 60 barrels of oil per day gross (18 barrels per day net to Pryme)
- Mechanical failures with the installation of Packers Plus production liner
- Well currently on pump
Austin Chalk Potential

- Extensive fracturing and oil and gas produced to surface during drilling were observed in both the Deshotels 20H and 13H wells.
- Third party engineering studies have confirmed this view.
- Sub optimal completion techniques and major mechanical issues during completion resulting in lower than expected production rates – Completion techniques have been refined using large independent oil and gas companies’ proven methodology.
- Acreage in Austin Chalk “sweet spot” surrounded by Anadarko and Atinum with Swift to the west.

Development of the Austin Chalk in Turner Bayou

- Development model using the following assumptions:
  - 920 barrel per day average Initial Production (IP)
  - 750,000 barrels of oil recovered per well (gross)
  - Typical production decline curve based on average analogue well production histories
  - US$17.5 million undiscounted cash / US$13 million NPV10 valuation per well net to Pryme
  - Well cost range US$2.8m to $3.2m net to Pryme (US$7m–US$8m gross per well)

![Graph: Typical Regional Austin Chalk Production Decline Curve]
Austin Chalk Field Development and Production Forecast Model

- Initial field development modeled on 640 acre spacing
- NYMEX future oil price / 3% per annum escalation in costs
- Cost per well of US$8m to the 100% working interest
- Up to 3 wells drilled in 2012 then 6 wells per year onwards

(Figures in model are net to Pryme)
Development Drilling Program Budget and Cashflow Model

- Next well to spud in the coming months
- Rig to drill back-to-back throughout 2013
- Postulated development plan of 6 wells per annum through to full development
- Development model indicates project will support its own development through cash flow generated from production from well number 3 onwards

(Figures in model are net to Pryme)
Tuscaloosa Marine Shale (TMS)

- A vertical completion was made in the TMS on our 3D survey in 1977 by Gulf which tested at initial rate of over 100 barrels of oil per day and associated gas with no stimulation.

- The Eagle Ford is an abnormally pressured source rock and is a target for shale gas and NGLs in South Texas. Deshotels well intersected the Louisiana Eagle Ford equivalent (the TMS) with minor reservoir rock with porosity up to 16% with very encouraging mud log shows. Compares favourably to some of the better locations in the Eagle Ford play in South Texas which exhibit porosities in the 6% to 12% range.
Resource Play Drilling Potential with Conventional Production Upside

- Producer with exploration and development upside through secured projects
- Proprietary 3D seismic to generate prospects in Turner Bayou
- Short lead time (months) of executing on Company maker

Strategy

- Drill most densely fractured Austin Chalk well location in Turner Bayou in coming months 2012 with significant engineering and operational changes
- Successfully drill and bring into production next Austin Chalk well – inline with regional initial production rates in excess of 1,000 barrels of oil per day
- Focus on the development of play; drilling another well within 30-60 days of completion of next well
- Multiple locations to drill and develop (up to 30 locations)
- Payback on successfully completed wells typically a matter of months due to strong initial production
- Expected to exponentially increase Pryme’s company wide production
